

# Data Cleaning & Preparation Report

Project 1 | Structural Integrity & Data Quality Architecture - DecodeLabs

Supervised By: DecodeLabs Quality Assurance Team | Document Type: Verification Artifact | Status: Approved **VERIFIED**

## 1. Project Overview & Context

This technical artifact documents the foundational stage of the data analytics pipeline applied over the 1,200 dataset records: Data Cleaning & Preparation. Real-world corporate spreadsheets are inherently prone to anomalies, missing entries, duplicated keys, and volatile formatting properties. Before running any advanced statistical profiling, this report establishes a certified 'Gold Standard' single source of truth.

|                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>■ INPUT (THE EVIDENCE)</b>                                                                                                                       |
| A raw, unscrubbed corporate dataset containing data gaps, duplicate row constraints under the OrderID vector, and inconsistent literal text fields. |
| <b>■ PROCESS (THE INVESTIGATION)</b>                                                                                                                |
| Execution of strategic missing value imputations, key-constraint duplication audits, and categorical string parsing and normalization.              |
| <b>■ OUTPUT (THE VERDICT)</b>                                                                                                                       |
| A mathematically consistent, perfectly cohesive, 100% completed database ready for Exploratory Data Analysis (EDA) pipelines.                       |

## 2. Data Cleaning Architecture (The 3 Core Phases)

• **Phase 1: Strategic Imputation (Handling Gaps)**

Rather than utilizing reckless listwise deletion which significantly reduces statistical power and deletes vital records, missing cells were audited. Continuous quantitative fields were strategically imputed using the Median to preserve variance without inserting outlier bias. Missing categorical text entries were given a structured fallback tag ('Unknown').

• **Phase 2: The Integrity Audit (Deduplication)**

Duplicate transaction logs compromise business visibility and artificially inflate performance metrics. A complete key-constraint audit was executed on 'OrderID'. Redundant rows sharing

identical operational tags were permanently stripped, ensuring one unique truth per transaction record.

• **Phase 3: Structural Format Correction**

Date records were normalized to a unified ISO 8601 string format (YYYY-MM-DD). Text variables within columns like 'Product' and 'PaymentMethod' were stripped of leading/trailing whitespaces and case-standardized to eliminate categorical fragmentation caused by typographical inputs.

**3. Diagnostic Quality Control Summary Table**

The operational metrics documented before and after executing the cleansing workflows are structured below:

| Data Quality Indicator | Pre-Cleaned State (Raw)        | Post-Cleaned State (Cleaned)   | Remediation Action Taken                                              |
|------------------------|--------------------------------|--------------------------------|-----------------------------------------------------------------------|
| Missing / Null Values  | 42 Empty Fields Scattered      | 0 Null Fields (100% Complete)  | Imputed via Column-Specific Median / Mode                             |
| Duplicate Rows         | 18 Redundant Transactions      | 0 Duplicates (True Uniqueness) | Removed redundant transaction records sharing identical OrderID keys  |
| Date Format Anomalies  | Mixed Strings / Slashes / Text | ISO 8601 Standard (YYYY-MM-DD) | Parsed, aligned, and normalized into a unified regional date standard |
| String Spacing & Case  | Messy Spacing and Padding      | Clean Standardized Text Keys   | Trimmed extra spaces and unified categorical text definitions         |

**4. Final Data Integrity Sign-Off**

By satisfying all evaluation quality criteria outlined in this verification report, the dataset is certified as a gold-standard data asset. All internal fields are structurally complete, uniform, and officially authorized to pass forward into Project 2 Exploratory Data Analysis pipelines.
